Semester Project Proposal

<u>Web Application</u>

<u>Concept:</u>

Personally, I have become frustrated with trying to figure out if my favorite sports teams are playing, when they are playing, whether or not my cable service provider will be broadcasting the game, and finding which channel the games will be shown. The other day I was trying to figure out when and what channel the Chicago Blackhawks were playing. I am aware that sometimes with basic cable not all Chicago Blackhawks games will be broadcasted. However, it takes so long to figure out all of this information only to find out that I won't be able to watch the game at all. Therefore, I want to create a web application that will consolidate all of this information and send it to me.

This web application will encompass factors such as specific sports, specific teams, teams' schedules, cable service providers, and location. All of these components are necessary to make the application work. The output of this information will be the action of sending an email to registered users. Users will have the ability to customize what information they get by choosing the sport, team, cable provider, and location that will best suit their needs.

I think this is a great idea and I know I will definitely used and by mentioning it to other people I know there will be others that use it as well. People want to know when they can watch their favorite sports, especially those without DVR capabilities.
